

ICT2142 E-Business Systems

MINI PROJECT - Project report

Name : K.P.S.B Pathirana

Week no : 01

TG no : TG/2024/2114

1. Introduction

Spices Lanka is a proposed E-Commerce website developed to sell authentic Sri Lankan spices online. The main purpose of this website is to provide a convenient platform for customers to browse and purchase a variety of Sri Lankan spices through the internet.

The website is designed for two main customer groups: **Sri Lankan customers and foreign customers**. Separate sections will be provided for these customer groups to support their different purchasing and delivery requirements.

The system will provide essential E-Commerce functionalities such as viewing products, searching and filtering products, user registration and login, shopping cart management, checkout, and order placement. These are among the core E-Commerce features identified in the practical requirements.

The website will be developed using **HTML, CSS, JavaScript, PHP, and MySQL**. These technologies will be used to develop the user interface, system functionality, and database.

2. Business Description

Business Name: Spices Lanka

Business Type: Online Spice Store

Spices Lanka is an online business that sells Sri Lankan spices through an E-Commerce platform. The website will allow customers to view available spice products, check product information and prices, add products to a shopping cart, and place orders online.

The main products offered through the website will include:

- Cinnamon
- Black Pepper
- Cardamom
- Cloves
- Turmeric
- Cumin
- Coriander

- Chili Powder
- Curry Powder
- Spice Mixes

The business will target two main customer groups.

Sri Lankan Customers:

Local customers who want to purchase Sri Lankan spices conveniently through an online platform. They will be able to purchase products using local customer and delivery information.

Foreign Customers:

Customers living outside Sri Lanka who are interested in purchasing authentic Sri Lankan spices. This group may include Sri Lankan expatriates and foreign customers interested in Sri Lankan food and spices.

The main goal of Spices Lanka is to make authentic Sri Lankan spices easily accessible to both local and international customers through an online shopping platform.

3. Requirement Analysis

The Spices Lanka website will require the following main functionalities.

Functional Requirements

1. Product Catalog

Customers should be able to view available spice products and their details.

2. Product Search and Filter

Customers should be able to search for products and filter them according to categories or prices. Product catalog, search, and filtering are identified as core E-Commerce features in the practical document.

3. User Registration and Login

Customers should be able to create an account, log in, and log out of the system.

4. Shopping Cart

Customers should be able to add products to the cart, remove products, and update product quantities.

5. Checkout and Order Placement

Customers should be able to provide their shipping address and place orders through the checkout process.

6. Local and Foreign Customer Support

The website should provide separate sections or purchasing options for Sri Lankan customers and foreign customers.

7. Payment Workflow

The system should provide an online payment workflow. For the project, this can be simulated rather than connected to a real payment service. The practical learning outcomes include simulating or integrating an online payment workflow.

Non-Functional Requirements

- The website should have a simple and user-friendly interface.
- The website should be responsive on different screen sizes.
- Customer information should be protected.
- The system should securely handle user authentication.
- The database should store customer, product, and order information reliably.

4. System Architecture

Spices Lanka will use a basic **web-based client-server architecture**.

Presentation Layer

The presentation layer will provide the interface that customers interact with.

Technologies:

- HTML
- CSS
- JavaScript

This layer will contain pages such as the home page, product page, login page, registration page, shopping cart, and checkout page.

Application Layer

The application layer will handle the main system logic.

Technology: PHP

PHP will handle:

- User registration and login
- Product information
- Search and filtering
- Shopping cart operations
- Checkout
- Order processing
- Payment workflow

Database Layer

The database layer will store and manage the system information.

Technology: MySQL

The database will store information related to:

- Customers
- Users
- Products
- Categories
- Shopping carts
- Orders
- Order items
- Payments

System Flow

Customer

HTML + CSS + JavaScript

PHP Application

MySQL Database

PHP Application

Website Interface

The architecture allows customers to interact with the website through the front-end, while PHP processes their requests and MySQL stores and retrieves the required data.
